APPENDIX D

BENEFITS

Navigation Benefit Analyses
for
Ponce DeLeon Inlet, Florida

Benefit analyses for Ponce DeLeon Inlet have undergone considerable revision since the inception of detailed feasibility studies in response to efforts to achieve justification based on commercial use in addition to evolution and refinement of engineering assumptions derived from the ongoing process of detailed studies. Engineering efforts have included basic engineering assessment(s) combined with considerable efforts for both physical and numerical modeling of physical inlet processes. In turn, evolving or resulting engineering assumptions concerning expectations for future channel conditions have had profound influence on refinement or determination of economic assumptions and related assessment of economic benefits. Generally, the overall process of project feature assessment has undergone four phases:

Ia. Reconnaissance-level studies; limited to placement of a seaward extension of the south jetty (approximately 1,000 feet in length).

Ib. The Initial phase of detailed studies which resulted in the determination that a seaward extension of the south jetty (approximately 1,000 feet in length) combined with placement of a landward extension of the north jetty (of approximately 800 to 900 feet) in turn connecting to a revetment extending generally further landward along the northern periphery of the interior of the inlet (for a distance of approximately 1,500 to 1,600 feet).

II. The second phase of detailed studies which involved placement of north and south jetty extensions, the interior inlet revetment, and waterway improvements (notably channel deepening) in addition to placement of commercial fishing park facilities in an effort to strengthen justification through intensified commercial use of the inlet.

III. The third and present phase of detailed studies limits efforts for economic justification to only seaward extension of the south jetty (approximately 1,000 feet in length) with a refined alignment derived from modeling studies[1].

---

[1] This revision to plan assessment is based on the determination that the north jetty extension and connecting revetment would be constructed in the future when required under requirements for operation and maintenance (O&M) of the existing Federally-sponsored project (and would therefor constitute sunk costs or costs common to both with and without-improvement conditions). In addition, requirements specific to placement of commercial fishing facilities also would not be implemented under this plan as it was ultimately decided the placement and operation of such facilities was unacceptable to the local constituency, and analyses revealed placement of such facilities with locally-mandated restrictions would not sufficiently

The remainder of the economic appendix is written to describe the general assumptions and related economic benefits according to the three latter phases described for detailed studies. Reconnaissance-level studies (phase Ia preceding; completed in January of 1993) are described in a separate document prepared before initiation of detailed studies which are currently in-process.

Description of Economic Analyses as Completed for Economic Justification of the South Jetty Extension, North Jetty Extension, Revetment, and Placement of Commercial Fishing Park Facilities (phases Ib and II preceding; completed in January of 1997; detailed study phases 1 and 2)

Proposed waterway improvements to Ponce DeLeon Inlet involve two measures. These include extending the south jetty approximately 1,000 feet in an alignment parallel to the existing north jetty combined with provision of 1,540 feet of revetment extending landward from the existing north jetty. The purpose of the revetment is to armour and stabilize the north side of the inlet shore bordering the section of the inlet leading to the Halifax River. It is anticipated these improvements will increase stability of the inlet system with a resulting shift of the present entrance channel away from the north jetty, and cessation or control of erosion within interior reaches of the inlet further northward than the alignment of the revetment.

Analyses for proposed improvements are based on the general assumption that proposed improvements will allow provision of unrestricted access to a clear or unoccluded waterway in accordance with design specifications for depth and width in the entrance channel, inlet throat, and tributary access or waterways leading to the Atlantic Intracoastal Waterway (AIWW) excepting uncontrollable restrictions imposed due to inclement weather and other unique or similar conditions. It should be noted that while economic analyses as described herein generally follow or adhere to the techniques and categories for benefits analyzed in reconnaissance studies, assumptions for future with-project and without-project conditions as applied for economic analyses have been revised considerably since release of reconnaissance findings in the latter part of 1993 (reference reconnaissance report for navigation improvements to Ponce de Leon Inlet dated January 1993).

Revisions to assumptions concerning future waterway

---

strengthen economic justification to offset total considered improvement costs with commercial benefits.

conditions are primarily as a result of additional information and data derived from physical and numerical modeling undertaken in 1995 and 1996 for detailed engineering and economic analysis of the inlet system. Consequently, a basic description of current or revised assumptions and primary differences from reconnaissance studies are provided in succeeding text.

Reconnaissance studies released in January of 1993 relied significantly on benefits derived from prevention of a catastrophic breakthrough or washout of the spit integral to the north shoreline extending from along the northern periphery of the inlet throat to the southern reaches of the branch waterway known as the Halifax River, which in turn ultimately leads to reaches of the Atlantic Intracoastal Waterway (AIWW) extending north of the subject inlet. It was estimated that such a breakthrough would be induced by a severe climatic event such as a hurricane or storm (i.e., level of occurrence approximately equal to a ten-year event), and that the resulting dispersal of sediment within the general physical confines of the inlet system would result in waterway conditions which by historical precedent, were found to be unnavigable for many commercial vessels which routinely use the inlet. The second category or source of project economic benefits were derived from estimated efficiencies in maintenance for the inlet system, particularly prevention or minimization of damages to the existing or without-project jetty system expected with migration of the channel northward which was anticipated would scour and eventually undermine the foundation material of the jetty itself.

As a consequence of the assumptions and work efforts within the time and scope of reconnaissance-level efforts the structure of average annual equivalent (AAEQ) economic benefits for justification of improvements was as follows:

I. Vessel Operations
- Avoidance of Lost Commercial Operating Income During Catastrophic Breakthrough (of the Spit) --> $49,200
- Commercial Vessel Fuel Savings with Avoidance of Catastrophic Breakthrough Condition(s) --> $29,500
- Reductions in Physical Damages to Commercial Vessels Associated with Catastrophic Breakthrough and Expected Long-Term Without-Improvement Conditions to Commercial Vessels --> $89,000
- Reductions in Physical Damages to Recreational Craft Associated with Catastrophic Breakthrough and Expected Long-Term Without-Improvement Conditions to Commercial Vessels --> $356,000

II. Project Maintenance and Operations (O&M)
- Reductions in Repair or Maintenance to the North Jetty --> $271,000
- Reductions or Elimination of Project\Waterway Repair

Costs Associated with Catastrophic Breakthrough of the Spit --> $357,000

As a result of detailed engineering studies coupled with physical and numerical modeling efforts, it has been determined that the best course for long-term management for operation and maintenance (O&M) of the inlet system with and without improvements would be to let the north spit area erode slowly over time (excluding a catastrophic event) as the branch waterway leading northward to the AIWW migrates northward until the shoreline is generally aligned parallel or coincident with the jetty extension and proposed revetment system. As long as a catastrophic event does not occur and cause significant dispersal of sediment within the inlet system between the base year of project economic life (currently 2001) and the year projected for required placement of the extension and revetment (currently 2002), current findings from modeling efforts indicate there will probably be little or no significant difficulty for navigability. In addition, this regime for inlet management also is complementary to current policies and decision criteria to take advantage of natural depths wherever advantageous as opposed to the rigid maintenance of a fixed waterway alignment at prohibitive costs. Given the relatively short period of time between the project base year and the year for placement of the jetty extension under without-project conditions, the propensity for benefits associated with a catastrophic breach have been virtually eliminated and no longer render a significant benefit for project justification[2]. Therefore benefit analyses have been revised to reflect the propensity(ies) for damage and realization of efficiencies associated with project implementation excluding considerations for a breach of the north spit.

In general, economic analysis of proposed improvements involved two basic components for derivation of project benefits. These included:

a.) Potential cost efficiencies or savings for both commercial and recreational vessel usage of the inlet

and;

b.) Savings in maintenance costs resulting from an analysis of historical and foreseeable repairs to the existing jetty system, and reductions in maintenance costs for removal of sediment or shoaling expected with a

[2] If a catastrophic breach of the spit area were to occur before its gradual erosion projected in 2001 to 2002, then such costs and efforts to clear or correct the waterway would be incurred prior to the beginning of project economic life and would be considered either common to both with and without-improvement conditions (i.e., effectively sunk) and\or would be accommodated under applicable measures for operation and maintenance (O&M).

relatively less stable inlet expected under without-project conditions.

The content of this section of the report addresses efforts to determine project economic benefits for vessel operations. Estimates for maintenance efficiencies from proposed improvements to existing navigation works are described elsewhere either in technical appendices or the main section of the comprehensive project report.

Cost efficiencies for commercial vessel operations entailed analysis of probable reductions in operations costs expected with proposed improvements and associated betterments in waterway conditions for vessel transit. Related efficiencies for commercial vessel operations include:

a.) reduction in expenses for vessel maintenance or physical damages (i.e., due to groundings, etc.),

b.) reductions in waterborne and landside transportation costs for commercial operations established or realigned under with-project conditions.

Analysis of Vessel Usage

Interviews were conducted with commercial fishermen and charter vessel operators to assess the nature of commercial operations and related costs associated with waterborne activities of the inlet. Interviews were also conducted with boatyard and vessel repair facility operators in the study region to assemble information on costs for maintenance or repairs which were\are deemed to be a result of unstable conditions within the inlet. Considerable assistance in gathering information on commercial vessel activities was also provided by the local project sponsor (the municipal government of Volusia County).

Information gathered during the course of interviews, review of available information for vessel registration, and inquiries by local government indicates that the existing commercial fleet for Ponce DeLeon Inlet consists of approximately 80 to 85 vessels that are either based in the area of the inlet or use the inlet on a seasonal or transient basis. Of the total of approximately 85 to 90 vessels identified, a total of 59 vessels have been identified as home port vessels and 24 to 27 were determined to be transient commercial harvest and charter fishing vessels which use the inlet consistently, but on a seasonal or transient basis from year to year. Of the homeport vessels, approximately 37 percent are commercial fishing boats, 58 percent are charter fishing operations, and the remainder, approximately 5 percent, are commercial passenger vessels or "head boats" employed for

party sportfishing or sightseeing excursions, or diving instruction and excursions. The 59 home port vessels identified were distributed between marinas, commercial fish or seafood processors situated along regional waterways, and boat yards located both north and south of the Inlet.

Historical and existing conditions of Ponce DeLeon Inlet have imposed considerable expenses for maintenance or repair of vessel damages. This has been attributable to physical migration of the channel system within the inlet and deposition of sediment in selected areas of the waterway system which sometimes precludes unencumbered passage by various vessels. Under current assumptions for without-project conditions it is anticipated that migration of waterways within the inlet system will continue with seasonal variation and that vessel damages will be incurred during such periods when channel location is relatively unstable.

Based on information assembled from interviews with vessel operators and available information for assessment of future channel conditions, it is estimated that the most significant period for such conditions will be in the late fall and winter of each year. Based on previous experience combined with review of U.S. Coast Guard (USCG) records for recreational vessel groundings, it is anticipated that difficulties with clearance for navigation will persist in areas between the north and south jetty, the throat of the inlet and tributary waterways, notably the Halifax River to the north and to a lesser extent, access via the Indian River to the south during the specified period of the year. Data gathered from various vessel facilities in the inlet area reveals that the most common repairs undertaken are refurbishment or replacement of propellers and shafts, with some repairs required for components of steering gear or fixed hull fittings.

Description of Commercial Benefits by Vessel Use

Investigations completed for detailed studies reveals that benefits will primarily be derived for established charter vessel operations and commercial fishing vessels expected to realign or establish operations at Ponce DeLeon inlet as a consequence of improvements and possible or proposed establishment of a commercial fishing park. Establishment of the proposed commercial fishing park is a consequence of efforts to increase or intensify commercial usage of the inlet and derive sufficient commercial benefits to (ideally) offset applicable project costs. Alternatively, with regard to existing vessel operations inquiries with local vessel operators reveals most commercial fishing vessels (such those employed for long-line fishing operations) would incur little or no difficulty due to familiarity with the inlet and considerable flexibility regarding scheduling of departure and arrival via the inlet system. Given

such findings, potential benefits for such vessels were not investigated given the expected magnitude of such benefits (i.e., minimal) relative to time and budgetary constraints for studies.

Commercial Charter Operations

Generally, one of the first requirements to assess the value of commercial vessel operations or marginal changes thereto for project analysis is to assemble or tabulate costs of operations and associated income. Presented in **Table D-1a** is a summary for annual costs, revenues and income for the aggregate charter vessel configuration applied for analysis. Costs as contained in Table D-1a were assembled via interviews with several vessel owners or operators based in the study area in addition to the application of data derived from past experience with other studies where subject data was not readily available for Ponce DeLeon Inlet. As portrayed, the average commercial charter vessel is approximately 43 feet in length overall with average annual revenues and net operating income of approximately $155,000 and $34,000 respectively[3]. From the cost and revenue structure portrayed in Table D-1a variable operating costs and returns to capital and labor per unit of time or occurrence employed can be measured to asses the benefits of reductions in time or costs of operation.

Investigations reveal that most or nearly all charter vessels experience some difficulty with present or without-project conditions in terms of minor groundings and excessive maintenance due to suspended sediments. Typically such costs involve bent propellers or minor damages to hull or control surfaces resulting from occasional contact with bottom areas which are sometimes less than ideally predictable due to migratory conditions of the channel bed. Other forms of damage or excessive maintenance costs include replacement of impellers and similar mechanisms due to significant sediment transport. While such damages are often minor enough to allow postponement or deferral of repairs, vessel downtime and repair requirements resulting in lost charters often present typical or average incidents and related repair costs when the vessel inventory is viewed as a whole. In addition to direct costs of repairs and lost business, additional costs are incurred as a result of labor time required to secure repairs. Values of marginal labor time or returns to labor are based on the per-unit-of-time returns derived from income and revenue summary (Table D-1a) adjusted for opportunity costs of time assessed at approximately one-third the

[3] It should be noted that some operators are part-time business participants and may earn less while full-time operators typically earn considerably more.

pre-tax wage.

Examination of costs per occurrence per vessel per year reveal costs average approximately $2,800 per year, and as stated previously, is derived from repair charges, loss of revenue or earnings, and the value of time or returns to labor. It should be noted that cost estimates reflect the occurrence almost every year of very minor costs combined with more significant costs or damages incidents which may occur once over a period of years. In addition, occasionally a charter vessel also incurs a significant or severe grounding incident which results in greater repair costs and greater downtime and loss of income[4]. Historically, available information indicates such occurrences number less than one per year on average over the period of time for available historical information (obtained from both local users and the U.S. Coast Guard).

Combined with damages, it is also estimated that many vessels lose between one and two charters per year due to conditions of the inlet when weather would still allow deployment at the insistence of clientele either for fishing or sightseeing. Review of Table D-1b reveals that the average annual equivalent (AAEQ) value of such costs that it is believed can be eliminated or reduced with proposed improvements totals a commercial vessel operations benefit of approximately $259,000. The number of vessels applied for computations is based on the known homeport fleet combined with full-time equivalent (FTE) conversion of seasonal or transient vessels, which results in an applied base of 49 vessels for common or frequent damages and excessive maintenance, and lost returns from canceled or lost charters[5].

A second category of commercial benefit uniquely attributable to inlet stabilization is the reduction in repair and personnel costs for open water trials for a local vessel manufacturer. Due to the changing or migratory conditions of channel bed areas in the inlet, the manufacturer must typically place an extra technician onboard to advise clientele unfamiliar with the inlet where and when (particularly on the south side of the inlet throat) a given vessel can safely pass. Nonetheless, it is estimated that 3 to 5 occurrences of vessel grounding (and related damages and downtime) occur per year resulting in

---

[4] Care must be taken to avoid double counting of potential project benefits when more than one category of benefit is being assessed for a particular event or circumstance. With regard to quantification of damages, even though labor time is alternatively use for repairs or efforts to return a given vessel to service, the value for lost income already includes allowances for opportunity costs of time and marginal expenses for vessel operations that would otherwise have taken place (without subject damages or downtime), therefore the estimate of damage cost is a net adjustment to base income with further cost adjustment for associated time and expense of repairs.

[5] Full-time equivalent (FTE) conversion of costs for aggregated analysis of the vessel inventory is based on employment of approximately 1,900 hours per year over a period of approximately 160 to nearly 220 days per year depending upon the vessel operator or nature of individual operations.

excessive direct costs and costs for value of time to company technicians and clientele. **Table 2** presents a summary or overview of costs based on grounding or damage occurrences which involve cost of retrieval of the vessel and passengers, direct costs of repairs, redeployment for completion of trials, and value of labor time for downtime (less adjustment for opportunity costs)[6]. Totaling such costs for reductions in escort personnel and damage occurrences which can be eliminated with improvements (i.e., 3 to 3.5 out of an average of 4.5 incidents per year) renders an average annual equivalent (AAEQ) value of $32,000 per year.

Placement of Proposed Commercial Fishing Park Facilities

Investigations undertaken during the course of the initial draft report for Ponce DeLeon Inlet reveal that many commercial vessel operators would relocate or seasonally call at Ponce DeLeon inlet if sufficient support facilities were available, notably dockage, availability of provisions, and access to a seafood wholesaler in a singular location. With the provision of a commercial fishing park in the proximity of Ponce DeLeon Inlet, it was learned that various business entities were interested in establishing seafood processing facilities, notably for shrimp and shellfish (notably crab and\or scallops). Tentatively, the most promising of these activities is the handling of rock shrimp and golden crab. Interviews with affiliated interests who operate supporting commercial vessels indicate waterway improvements and landside facilities may render efficiencies that could be derived from reduced open water transit time for some deployments in the northern reaches of the rock shrimp fishery while also helping to support the possible opening of a new harvest area for golden crab in the northern zone of the overall golden crab fishery.

As with commercial charter vessels, information on costs and revenues was compiled via interviews for typical vessel configurations expected to harvest rock shrimp and\or golden crab in the foreseeable future. These relationships were used to assemble aggregate vessel operational characteristics from which in turn marginal costs or benefits based on reduced variable costs or value of labor time were derived[7].

---

[6] Additional detail is not provided at the request of the vessel manufacturer as such information is considered proprietary or confidential in nature.

[7] Currently, few rock shrimp vessels consistently call at commercial facilities located in the vicinity of Ponce DeLeon Inlet but available information indicates that a total regional vessel inventory of approximately forty (40) to forty-five (45) regional vessels which harvest rock shrimp either on a part-time basis or as a primary catch would benefit from availability of a port of call at the location tentatively proposed for seafood processing facilities. Of these, it is estimated that approximately one third would make one to two calls per year while approximately one-half to two thirds of the remaining vessels would

Table series D-3a through **D-3c** presents costs and revenues for rock shrimp transportation operations. Summary relationships for vessel operation (operating costs and revenues) are listed in Table D-3a followed by Table D-3b which provides the estimated number of vessel trips or transits (and associated changes in variable costs for vessel assets and labor time) which could be efficiently diverted each year or season with establishment of commercial fishing park facilities and relative time to\from harvest grounds versus alternative facilities[8]. Table D-3c presents changes for landside transportation and distribution of whole-weight and processed product based on location of seafood processing facilities proposed for the establishment of the commercial fishing park. As revealed by Table D-3b, reductions in open water transit costs with facilities at Ponce DeLeon Inlet total approximately $30,490 per year, while cost efficiencies for landside transport of landings total approximately $128,230 as listed in Table D-3d. It should be noted that Table D-3d provides efficiencies (due to fishing park location versus alternative processing sites) for transport of catch from alternative docks in mid or southern Florida to fulfill the balance of required processing facility throughput (totaling a minimum of 1,375,000 pounds; whole weight) which cannot be achieved with the estimated number of cost-effective diversions of vessel transits (and average landings per vessel trip). Also presented in Table D-3c is the estimated cost efficiency for distribution of processed product to distributors for furthering to buyers for end-use or consumption throughout the Southeastern United States from a processing facility located north of existing facilities presently located at Port Canaveral or further south such as Miami or Fort Pierce[9]. Combining estimated values for estimated transport cost reductions renders a total benefit for rock shrimp operations of $158,720 per year.

Undertaking the same basic analysis for golden crab as for rock shrimp results in the cost and revenue relationships for golden crab operations as portrayed in Table Series D-4a through D-4d. It should be noted that little information was available regarding a precise vessel configuration for harvest of golden

---

call at the realigned location once per year or season. Analyses according to aggregate classes are described later in this economic appendix. It should be noted that class delineations were not disaggregated or analyzed specifically according to draft or length for drafts less than 10 to 10.7 feet as plan formulation was not based on known or predictable changes in reference depths compared to without-project conditions, but measures for stabilization of the existing project. Based on estimates of the regional vessel inventory, it is estimated that commercial facilities will need to be sized to accommodate a minimum of 27 to 28 vessels but no more than approximately 35 vessels at one time (depending on size, etc.) including support facilities for Golden or Red Crab and vessel repair facilities, both of which are later discussed in this appendix.

[8] Associated costs for proposed fishing park facilities are described in the main section of the overall project report.

[9] Benefits include the comparative costs of landside transport necessary for whole versus processed weight of shrimp based on establishment of proposed facilities.

crab and supporting operations that would be based at Ponce DeLeon Inlet[10]. Existing vessels in the fishery employed in south Florida were not necessarily considered representative as the emerging northern zone fishery is believed to be a relatively large-vessel fishery due to rigging and equipment required to efficiently work grounds which are at greater depths and subject to more significant currents (in the northern zone). Therefore, the basic configuration for the 92.4-foot rock shrimp vessel was employed for analysis with adjustments for trip duration, catch, and revenue per pound. Based on described analytical efforts and subject to compliance with applicable fishery management plans, benefits and costs described by Table series D-4a through D-4c total approximately $116,130 per year for waterborne and landside transportation cost efficiencies.

Provision of Commercial Marine Railway or Minor Maintenance Facility(ies)

As stated previously, investigations undertaken during the course of the initial draft report for Ponce DeLeon Inlet reveal that many commercial vessel operators would relocate or seasonally call at Ponce DeLeon inlet if sufficient support facilities were available, notably dockage, availability of provisions, and access to a seafood wholesaler in a singular location. An integral part of such facilities is the provision of a marine railway or minor vessel maintenance facility to serve commercial vessels which would serve seafood processing operations of the proposed park, or other commercial vessels in the local area. The advantage of such a facility is that many commercial operators indicated a need to often travel a considerable distance to find service facilities due to price, unique requirements, or lack of yard or facility capacity at peak periods during the year. Typically, the use of more distant

---

[10] Available information for the golden crab fishery indicates that existing operators primarily harvest resource from the southern and to some extent the middle zones, with little or no harvest operations in the northern zone located to the west and north of Ponce DeLeon Inlet. Review of fishery management plans for Golden Crab indicate that yields from the northern reaches of the middle and northern zones could probably support two to five vessels depending on productivity and intensity of employment, and capitalization. Due to uncertainty of some parameters for related fishing operations, benefit analyses are based on employment of three vessels generally configured in size and respective costs for vessels of sufficient class to harvest traps from the deeper waters of the norther zone. The applied allocation of vessels based or homeported at proposed facilities for crab harvests includes one vessel approximately 60 to 65 feet in length overall with two other vessels 90 to 95 feet in length overall (LOA). Of these, it is estimated each vessel derived logistical efficiencies for 14 to 17 deployments per year with a efficiencies for a minor number of potential transient and\or part-time participants. Alternatives for land-based facilities include locations in the Miami area, Marathon Key (Florida Keys), and Port Canaveral to the south, and facilities in Jacksonville (Florida) or further northward. Analyses according to aggregate vessel classes are described later in this economic appendix. It should be noted that class delineations were not disaggregated or analyzed specifically according to draft or length for drafts less than 10 to 10.7 feet as plan formulation was not based on known or predictable changes in reference depths compared to without-project conditions, but measures for stabilization of the existing project. Based on estimates of the regional vessel inventory, it is estimated that commercial facilities will need to be sized to accommodate a minimum of 27 to 28 vessels but no more than approximately 35 vessels (depending on size) at one time including support facilities for Rock shrimp and vessel repair facilities, both of which are discussed elsewhere in this appendix.

repair facilities requires the dispatch and retrieval of the vessel, and transport of the crew to and from the vessel via landside transport. The operation of both the vessel and landside vehicle impose a direct cost of securing vessel repairs while time required of labor imposes a value of time cost either for downtime from productive activities to support the fishery or other activities.

Table D-5 summarizes estimated direct costs for vessel and vehicle operation for marginal transit, and time saved in addition to value of time saved for labor (adjusted for opportunity costs). Unit costs as presented were derived from weighted cost and revenue relationships derived from operation of vessels employed for harvest of rock shrimp and golden crab previously described. A composite was used for vessels projected to serve or call at the commercial fishing park given limited availability of information regarding what vessels would actually use the maintenance facility. As stated previously, the cost of repairs for commercial vessels involves both labor time and direct costs for operations. Such costs as described in Table D-5 include dispatch or transit of the vessel to the repair facility in addition to costs of landside transport to retrieve the crew or personnel after arrival at a given service facility. Upon completion of repairs, costs for landside transport and labor time must also be expended to retrieve the vessel and return it to productive service.

Based on a general assumption that costs of repairs would be comparable to alternative facilities combined with expected operation ten months of the year (at three vessels per month) a total of thirty vessels would be serviced per year resulting in a cost efficiency for minimized or marginal travel of approximately $1,570 per vessel or $47,100 per year. Given an assumption of no increase in growth over the planning horizon, the stated annual value equates to an average annual equivalent (AAEQ) value for project analyses[11].

Recreational Vessel Benefits

The analysis of recreational vessel benefits for Ponce DeLeon Inlet is based on general recreation analysis procedures authorized for USACE-sponsored studies of small harbor projects.

---

[11] The assumption of no growth for occurrences is based on the assumption of no growth for the regional commercial fishing fleet associated with the assumption of no significant increase in landings or exploitation of commercial marine resources related to intensity of employment. Distances for vessel and landside vehicle transit are based primarily on usage of alternative facilities in the area of Port Everglades to the south, or Jacksonville (Florida), Savannah (Georgia), and St. Augustine to the north with occasional use of facilities as distant as North and South Carolina depending on the timing of need for repairs and demand for facilities during respective fishing and tourist seasons. Associated costs for placement of repair facilities are covered in the main section or the overall project report.

Little information was readily available quantifying the frequency and nature or extent of use of the inlet by private recreational craft. Cursory interviews were conducted with local marina operators and resulting information was combined with experience derived from other small inlet studies for Florida and available information for estimates of recreational craft based in the region to determine estimates of the nature or frequency of waterway use. Vessel operating characteristics of the inlet were generally assessed and related estimates of usership (based were applied to determine the value of recreational use based on variances in unit day values[12]. In addition to analyses for application of unit day values, related estimates for frequency of operations were also applied to available information on vessel operating parameters to determine costs or expenses (i.e., such as damages) considered to be associated with inlet conditions and which could be eliminated or minimized with waterway improvements.

Particular to costs or expenses which could be minimized or eliminated, it was determined from interviews that most vessel damage costs or expenses attributable to unfavorable migratory conditions of the inlet encompassed three general categories. Subject categories include[13]:

a.) Reductions in damages for severe or significant vessel groundings;

b.) Reductions in damages for vessel capsizings;

and

c.) Reductions in damages for common or unreported incidents (i.e., moderate or minimal damages)

The three aforementioned categories of vessel damages or costs primarily differ with magnitude of average costs and expected or relative frequency. In addition, estimates for frequency and location for severe vessel groundings and capsizings were obtained from data compiled for the Search and Rescue (SAR) reporting system maintained by the United States Coast Guard (USCG). Such events are considered severe or significant given that the Coast Guard is generally directed to respond to such incidents only when lives are in peril or at risk. Unreported incidents pertain to typical or common damages

---

[12] **Source(s): Florida State Comprehensive Outdoor Recreation Plan (SCORP); 1994.**

[13] **Benefits for groundings and capsizings are subject to change based on revised or more detailed information to be provided by the United States Coast Guard (USCG) regarding probable cause and location of historical vessel mishaps or incidents for which the USCG has responded or intervened.**

attributable to dynamically changing conditions of the inlet which result in movement or unpredictability of the inlet channel system, and vessels in transit feeling the bottom or side slope of the channel. Such incidents are classed as unreported given that formal reporting of incidents is not undertaken by any formal entity (such as for severe groundings and capsizings by the USCG), and many resulting repairs are performed by either the vessel owner or small local marine repair facilities.

All three categories of vessel damages or costs include assessment of costs for vessel machinery or equipment, and repairs or maintenance for hull surfaces ranging from minimal (such as repitching and recupping a bent propeller) to catastrophic losses or severe vessel damages which occur infrequently. Repairs for damages to hull surfaces include structural repairs to hulls to repair breaches or cracked and punctured hull forms in addition to reglassing and painting of hull surfaces. Damages to machinery or equipment primarily entail damages to propulsion and steering gear equipment such as propellers, rudders, shafts and struts, lower units for outboards or stern drives, and other underfittings such as protective plates or shoes. Catastrophic damages, are generally related to severe groundings or vessel incidents which often require salvage efforts to recover the vessel and\or extensive repairs to both hull surfaces and structural members, and machinery[14].

Information obtained from local marina owners and specialized marine repair vendors (such as for propeller repair or reconditioning) included estimates of vessel damages based largely on general familiarity with historical or past experience. Investigations with both representatives of marinas and vessel operators indicate that adverse or less than ideal conditions for Ponce DeLeon Inlet prevail generally throughout the year with the most notable adverse conditions occurring after severe weather or storm events and during the late fall or winter months spanning a time period of from four to five months, to as long six months. Applicable seasonal duration of conditions which impose operational limitations depends on the variability in prevailing weather conditions from day to day, and on the suitability of a given vessel for such conditions based on physical specifications (i.e., relative to maximum draft, length, freeboard, stability, etc.).

Damage *valuations* were assessed from general estimates according to recent record(s) or local knowledge as available,

---

[14] **Efforts to estimate catastrophic vessel damages proved difficult for Ponce DeLeon Inlet within the scope of studies as such occurrences are much less frequent than for typical or common damages as described, and are based on few instances in recent years. Similar to common damages for many craft, the imposition of catastrophic damages typically occurs to many vessel operators who are transient from outside the region and\or not intimately familiar with limitations of the waterway under adverse or sub-optimal conditions. However, based on available information, applied estimates of related damages were cursorily formulated based on general estimates of costs for severe groundings and near loss of vessels in recent years.**

notably the past two to three years, with adjustment to current cost levels. Costs or expenses per occurrence include an assessment of both direct or explicit costs, and costs for the value of time saved with reduction or elimination of related damage incidents.

Costs for the value of time saved to the operator or vessel owner were derived from the avoidance of needing to expend labor time to secure assistance and\or facilitate repairs[15]. As a basis for values, general estimates of labor time potentially saved were assembled from cursory interviews combined with experience based on prior small harbor or inlet studies given limited availability of information for Ponce DeLeon Inlet[16].

Based on experience with other small inlet studies, most common or typical damages require the expenditure of from as little as one or two to nearly twelve man-hours for most vessel owners for repairs performed by others (for pay), with a range of from less than one to three man-days (assuming eight man-hours per day) or more for significant repairs carried out by the owner or operator. Little information is available for Ponce DeLeon Inlet users concerning a precise estimate of employment of professional repair services (i.e., services for hire) versus repairs undertaken by vessel owners\operators themselves. Cursory inquiries indicate that the majority of vessel owners in the region employ professional services for most, but not all, significant vessel service or repair requirements.

Costs or expenses *per occurrence* as reported for vessels damaged while transiting at Ponce DeLeon Inlet, for the purposes of analysis, are assumed to remain constant or invariable from year to year of project economic life. This assumption was based on limited availability or the absence of information concerning any detailed explicit relationship(s) between the incurrence of damages relative to intensity of waterway use needed for variable projection(s). *Growth* in the *frequency* of occurrence(s) was

[15] Specified value per hour is derived from the estimates for recommended values for time as contained in Institute of Water Resources Report (IWR) 91-R-12 titled Value of Time saved for use in Corps Planning Studies: A Review of the Literature and Recommendations (October 1991). Values per unit of time derived from Table 2; page 23 respective to value of time saved for based on median income as averaged for occurrence and adjusted to projected price levels for calendar 1996. The average of values was selected given that detailed information was not available as to the true disposition of expended time and related opportunity costs (i.e., though time expended for repair for a recreation craft may generally constitute an expenditure for recreational activities, whether the time used actually constitutes marginal social or recreation as opposed to time away from income-earning activities such as work and earnings foregone could not be determined from information at the time of preparation). Therefore, combined with the general limited range of all values for time savings, aggregate values were applied for the purposes of studies.

[16] The amount of time expended to facilitate vessel repairs ranges considerably depending upon the extent of work required and the willingness and skills of individuals to either perform repair work themselves or to diligently seek information and pricing before selection of a particular repair facility. As an example, some individuals may choose to use a preferred facility with which they have an established relationship and therefore may expend as little as one to two man-hours to secure and pay for vessel repair. At the other extreme, severe vessel damages may necessitate the pursuit of competitive bid estimates and significant time for discretion in selection of a repair facility and affiliated professional services.

estimated based on projections for saltwater fishing (by vessel) and saltwater vessel ramp use in the general region as contained in the *Florida State Comprehensive Outdoor Recreation Plan (SCORP)*[17].

Based on the preceding general description, damages for severe or significant groundings of recreational vessels (as responded to by the USCG) which use Ponce DeLeon Inlet total an average for all vessels of approximately $5,030 per occurrence per year based on values for direct costs and value of time totaling $4,810 and $220, respectively. Applying an average of approximately 17.1 vessel occurrences in the base period of projections, 1997 renders a total of approximately $85,760 when adjusted for growth to the base year of project economic life, 2001. Average annual equivalent (AAEQ) tabulations for specified vessel class delineations in addition to overall average estimations are presented in **Table D-6a**, and total approximately $111,640 given growth in vessel use derived from the SCORP, a fifty (50) project economic life, and annual interest or discount rate of 7 1/8 (.07125) percent.

While this number may appear relatively low compared to the total number of recreational vessel groundings as reported by the USCG, it should be noted USCG statistics were reviewed to exclude groundings or incidents attributable to causes which would in likelihood not be uniquely rectified or eliminated with stabilization of the inlet system. It should also be noted that interviews with users or operators of local marinas reveal that many individuals who reside in the area and frequently use the inlet are aware of the inlet's limitations due to seasonal conditions, and they employ such knowledge to, where possible, safely navigate the inlet. Hence, indications are that the majority of common or typical vessel damage costs are attributable to unfamiliarity with seasonal or changing conditions of the inlet stemming from infrequent use by some area vessel operators, and transient use by vessel operators from outside the study region.

The second category of project recreation benefits, reductions in direct costs and value of time expended for damages from vessel capsizings were also assessed in similar form to severe groundings based on a review of USCG statistics and interviews or available information concerning typical expenses or needed repairs for such occurrences. Correspondingly, examination of **Table D-6b** reveals an average occurrence of 4.5 incidents per year for 1997 at a total average cost of approximately $8,780 for direct costs ($8,030) and value of time ($750). Average annual equivalent (AAEQ) benefits total approximately $51,370 given the specified project economic life,

interest or discount rate, a project base year of 2001, and growth in inlet use as derived from the SCORP document.

The benefit category of reductions in damages and costs for unreported damage incidents is presented in **Table D-6c** and totals an average annual equivalent (AAEQ) value of approximately $144,830. This value is based on estimates of occurrence and expenses derived from cursory interviews with local interests and operators of repair facilities and is derived from approximately 114 to 115 vessel occurrences per year at a total cost of $980 per occurrence for 1997. Similar to estimates for groundings and capsizings, growth in occurrences were escalated by growth in recreational vessel use as derived from the SCORP document.

In addition to reductions in vessel operating costs, the remainder of recreational benefits are based on variances for unit\user day values (UDVs) assessed for waterway conditions unique to Ponce DeLeon Inlet[18]. Unit day values were assessed for Inlet conditions expected to prevail for recreational craft with and without implementation of proposed improvements. Any net increase or decrease in value per user day or occurrence associated with implementation of proposed improvements is deemed either a net benefit or cost, respectively. The derived unit day value differential ranged from approximately $.75 to $.83 per user-day or occurrence derived from current point monetary values authorized for studies during fiscal year (FY) 1997 and are presented in **Table D-6d**. Point estimates for general hunting and fishing were applied to the average number of vessel occupants or boaters estimated to transit or use waters of the inlet and the adjacent shoreline area. The average increase in unit\user day value was applied to vessel activity or use based on expectations of improved conditions expected with proposed stabilization measures. Based on general estimates of the frequency of use and average vessel occupancy as provided in Table D-6e combined with general prevalence or number of applicable vessels in the study area thought to be routinely employed for open water or near-shore activities, the estimated annual benefit for unit day values totals approximately $107,530 for 1997 and is also provided in Table D-6e. Applying growth projections derived from the SCORP document in similar form to projections for damages previously described, renders average annual equivalent (AAEQ) values totaling $158,330 in Table D-6e for the applied period of project economic life and interest or discount rate.

Combining all benefits as described for recreational vessel operations as described results in a summary total average annual equivalent (AAEQ) value of ***$466,170***. **Table D-6g** provides a

summary listing of all recreational vessel benefits according to category and general vessel class.

Summary of Economic Benefits

Combining commercial and recreation benefits results in an estimate of total economic benefits for project justification. A summary of both commercial and recreation benefits as presented in **Table 7** provides average annual equivalent (AAEQ) values for benefits for proposed stabilization measures both with and without placement of commercial fishing park facilities totaling ***$1,079,100*** and ***$757,150***, respectively.

Ponce DeLeon Inlet, Florida)

Summary Table for Average Annual Equivalent (AAEQ) Benefits by Aggregate Vessel Class

Estimated Economic Benefits for Reductions in Vessel Damages and Lost Charters for Commercial Charter Fishing Vessels

Economic Life:: 50 years
Applied Interest\Discount Rate: 7.125%

General Vessel Class; Length Overall (in feet): 42.6 feet
Applied Number of Vessels: 49 Vessels (per year; average)

Average Number of Lost Charters Avoided: 1.6 Charters
Physical Damages\Excessive Maintenance Avoided: $1,850 per vessel (average)

Losses to Contributions for Fixed Costs Avoided: $520 per vessel (average)
Losses to Direct Returns to Labor Avoided: $290 per vessel (average)
Value of Labor Time Saved: $170 per vessel (average)

Benefits by Category for Specified Aggregate Charter Vessel Class

General Vessel Damages\Maintenance Avoided

General Vessel Class; Length Overall (in feet): 42.6 feet
Applied Number of Vessels: 49 Vessels (per year; average)

Average Number of Lost Charters Avoided: 1.5 Charters
Physical Damages\Excessive Maintenance Avoided: n/a per vessel (average)

Losses to Contributions for Fixed Costs Avoided: $430 per vessel (average)
Losses to Direct Returns to Labor Avoided: $240 per vessel (average)
Value of Labor Time Saved: n/a per vessel (average)

Charters Lost or Foregone Avoided

General Vessel Class; Length Overall (in feet): 42.6 feet
Applied Number of Vessels: 0.80 Vessels (per year; average)

Average Number of Lost Charters Avoided: 5.2 Charters
Physical Damages\Excessive Maintenance Avoided: $6,370 per vessel (average)

Losses to Contributions for Fixed Costs Avoided: $1,500 per vessel (average)
Losses to Direct Returns to Labor Avoided: $850 per vessel (average)
Value of Labor Time Saved: $560 per vessel (average)

Severe Damages\Catastrophic Losses Avoided

Summary Total(s), All Benefit Categories

General Vessel Class; Length Overall (in feet): 42.6 feet

Average Number of Lost Charters Avoided: 3.4 Charters
Physical Damages\Excessive Maintenance Avoided: $1,954 per vessel (approximate average)

Losses to Contributions for Fixed Costs Avoided: $974 per vessel (approximate average)
Losses to Direct Returns to Labor Avoided: $544 per vessel (approximate average)
Value of Labor Time Saved: $179 per vessel (approximate average)

[1.] Florida State Comprehensive Outdoor recreation Plan (SCORPS); from base year of 1996. [2.] Depths in feet projected without proposed waterway improvements, and referenced to mean low water (MLW).

Table 2
Ponce DeLeon Inlet, Florida
Estimated Benefits for Sea Trials Undertaken Via Ponce DeLeon Inlet
*Reduced Labor and Damage Costs for Sea Trials **

	Without–Project	With–Project
Total Estimated Number of Vessel Deployments Per Year for Open Water Trials (average):	58.5	58.5
Deployments With No Significant Difficulties Attributable to Inlet Dynamics Unique to Without–Project Conditions:		
Average Deployment of Vessels Per Year	54.0	57.5
Technicians Involved (average per trip)	2.5	1.5
Customers\Observers Involved (average per trip)	3	3
Total Estimated Labor Costs	**$94,720**	**$82,530**
Estimated Costs Due to Grounding or Damages Attributable to Dynamic or Migratory Inlet Conditions:		
Estimated Number of Damage Occurrences (per Year)	4.5	1.0
Technicians Involved (average per occurrence)	2.5	1.5
Customers\Observers Involved (average per occurrence)	3.0	3.0
Retrieval Crewman Involved (per occurrence)	1.5	1.5
Repair Technicians Involved (per occurrence)	1.5	1.5
Total Estimated Labor Costs	$14,170	$2,710
Total Direct Costs of Repairs	$1,880	$420
Subtotal(s)	**$16,050**	**$3,130**
Requirements for Resumption\Completion of Sea Trials:		
Number of Vessel Redeployments	4.5	1.0
Technicians Involved (average per occurrence)	2.5	1.5
Customers\Observers Involved (average per occurrence)	3.0	3.0
Total Estimated Labor Costs (average per occurrence)	$1,510	$1,130
Marginal Customer Travel\Accommodation Costs (per occurrence)	$350	$350
Subtotal(s)	**$8,370**	**$1,480**
Total Applied Cost(s)	$119,140	$87,140
Reduction or Differential (i.e., project benefit)		$32,000

* *Detail of labor and operating costs not presented as associated information is considered proprietary by vessel manufacturer.*

Table D–1a
Ponce DeLeon Inlet, Florida
Commercial Charter Fishing Vessels
Summary Table for Example of Aggregate Average Annual Costs, Revenues, and Income

Vessel Aggregate Class Statistics		
Average Vessel Length (Overall; in feet)		42.6
Average Vessel Length at Wateriline (or between perpendiculars; in feet)		39.9
Average Vessel Breadth or Beam (extreme; in feet)		14.6
Average Vessel Draft (loaded; in feet)		5.1
Operating Costs		
Fixed Operational Costs		
– Interest and Amortization (Hull\Superstructure)		$32,160
– Hull & Superstructure		$310
– Propulsion\Power Plant(s)		$470
– Rigging		$490
– Support Facility\Berthing Expenses		$4,340
– Insurance		$3,650
– Administration\Accounting\Legal\Permits\Licensure		$4,160
	Subtotal	$45,580
Variable Maintenance Costs		
– Hull & Superstructure\Rigging		$5,750
– Propulsion\Power Plant(s)		$6,810
	Subtotal	$12,560
Variable Operational Cost(s)		
– Fuel		$34,220
– Oil\Lubrication		$2,200
– Bait\Tackle		$2,760
– Ice		$2,060
– Consumables\Subsistence		$1,900
– Advertising\Booking & Schedule Adminstration		$7,080
– Hired Crew Compensation		$12,490
	Subtotal	$62,710
Average Total Cost(s)		
Fixed Operational Cost(s)		$45,580
Variable Maintenance Cost(s)		$12,560
Variable Operating Cost(s)		$62,710
	Subtotal	$120,850
Average Annual Revenue		$154,820
Net Average Operating Income		$33,970
Average Number of Days Employed Per Year		163
Average Number of Trips per Year		172
Average Duration of Trip (hours)		10.2
Average Hours Employed Per Year		1,756
Average Wage Per Hour for Hired Crewman		$7.11
Average Wage\Return Per Hour for Captain		$16.88

Table D–3a
Ponce DeLeon Inlet, Florida
Commercial Fishing Vessels (Rock Shrimp)
Summary Table for Example of Aggregate Average Annual Costs, Revenues, and Income

Vessel Aggregate Class Statistics			
Average Vessel Length (Overall; in feet)		69.7	92.4
Average Vessel Length at Waterline (or between perpendiculars; in feet)		63.2	85.5
Average Vessel Breadth or Beam (extreme; in feet)		18.3	21.9
Average Vessel Draft (loaded; in feet)		10.7	12.3
Operating Costs			
Fixed Operational Costs			
– Interest and Amortization (Hull\Superstructure)		$34,960	$54,500
– Hull & Superstructure		$560	$740
– Propulsion\Power Plant(s)		$840	$1,120
– Rigging		$880	$1,160
– Support Facility\Berthing Expenses		n/a	n/a
– Insurance		$5,540	$5,830
– Administration\Accounting\Legal\Permits\Licensure		$6,370	$6,290
	Subtotal	$49,150	$69,640
Variable Maintenance Costs			
– Hull & Superstructure\Rigging		$14,100	$21,800
– Propulsion\Power Plant(s)		$12,710	$17,570
	Subtotal	$26,810	$39,370
Variable Operational Cost(s)			
– Fuel		$31,300	$39,720
– Oil\Lubrication		$4,880	$7,390
– Consumables\Subsistence		$2,980	$2,480
– Hired Crew Compensation		$49,280	$82,100
	Subtotal	$88,440	$131,690
Average Total Cost(s)			
Fixed Operational Cost(s)		$49,150	$69,640
Variable Maintenance Cost(s)		$26,810	$39,370
Variable Operating Cost(s)		$88,440	$131,690
	Subtotal	$164,400	$240,700
Average Annual Revenue		$239,980	$365,460
Net Average Operating Income		$75,580	$124,760
Average Number of Days Employed Per Year		126	105
Average Number of Trips per Year		11.5	5.3
Average Duration of Trip (Days)		11.0	20.0
Average Hours Employed Per Year		1,575	1,313
Average Wage Per Hour for Hired Crewman(men);	2 in number	$8.97	$17.93
Average Wage\Return Per Hour for Captain;	1 in number	$13.35	$26.70

Table D–3b
Ponce DeLeon Inlet, Florida
Commercial Fishing Vessels (Rock Shrimp)
Summary Table for Reductions in Variable Vessel Costs
With
Placement or Location of Commercial Fishing Park

General Vessel Class [1.]		
Average Vessel Length (Overall; in feet)	69.7	92.4
Average Vessel Draft (loaded; in feet)	10.7	12.3
Average Number of Trips Per Year for Which Shorter Transit Time is Applicable:	37.2	1.7
Average Number of Hours Trip Transit Time is Reduced Per Transit Leg:	8.5	8.5
Applicable Number of Transit Legs Per Trip for Reduced Time: [2.]	1.5	1.5
Average Variable Cost(s):		
– Vessel Operating Costs	$38.55	$63.63
– Value of Labor Time (net of opportunity costs)	$20.86	$41.70
Subtotal(s)	$59.41	$105.33
Estimated Reduced Costs by Class per Year:	$28,200	$2,290
Estimated Total Reduced Waterborne Logistical Costs (i.e., benefit):		**$30,490**
Total Poundage Carried Via Realigned Vessel Operations:		
– Average per Trip (whole or live weight)	19,410	53,200
– Total Poundage (whole or live weight)	722,580	90,770
Total Poundage (whole or live weight)		813,350

[1.] Aggregate classes represent a total fleet of approximately 40 to 45 individual vessels of which approximately sixty–five to seventy percent approximate the 60.7–foot class and the remainder approximate or are aggregated for the 92.4–foot class.

[2.] An average of 1.5 trip legs or transits is applied given that some proportion of the time, either for the inbound or outbound leg, a given vessel will be closer to equidistant from another land–based facility depending on the geographical location of the vessel upon completion of the final deployment of harvest gear (or "drag" of netting equipment) while fishing in a northward or southward direction. Such physical placement does not constitute a marginal logistical betterment for location of the proposed fishing park and associated facilities. In the absence of specific information concerning vessel geographical placement, a proportion of .5 or fifty percent was applied to one leg or transit for a each trip.

Table D-3c
Ponce DeLeon Inlet, Florida
Commercial Fishing Vessels (Rock Shrimp)
Summary Table for Reductions in Landside Transportation Costs
With
Placement or Location of Commercial Fishing Park

Estimated Lanside Transport Cost Reductions:	
Estimated Minimum Annual Poundage Throughput of On-Site Processing Facility (whole or live weight)	1,375,000
Poundage Originating from Realigned Vessel Operations (whole or live weight)	813,350
Poundage Transported Landside from Alternative Dockage Facilities for Processing (whole or live weight)	561,650
Estimated Cost(s) for Landside Shipment Per Pound Per Hundred Miles	
– Per pound; Whole or Live Weight	$0.077
– Per pound; Processed Weight	$0.108
Estimated Dockage Cost Per Pound from Alternative Facility (whole or live weight)	$0.055
Approximate Conversion Factor (for whole-to-processed weight)	1.670
Landside Transport Costs Without Commercial Park:	
Transport of Whole or Live-Weight Poundage to Processing Facility(ies)	
– Applied Pre-Processed Poundage	1,375,000
– Associated Dockage or Facility Offloading and Handling Charges [1.]	$75,630
– Average Minimum Landside Transport Distance (miles)	90.0
– Associated Landside Transport Charges	$95,290
Transport of Processed Poundage for Further Distribution:	
– Applied Processed Poundage	823,350
– Applied Marginal Distance Without Proposed Commercial Fishing Park (miles)	20.0
– Associated Landside Transport Charges	$17,700
Summary Total Cost(s):	**$188,620**
Landside Transport Costs With Commercial Park:	
Transport of Whole or Live-Weight Poundage	
– Applied Pre-Processed Poundage	813,350
– Associated Dockage Handling Charges [1.]	$44,730
– Average Landside Transport Distance (miles)	25.0
– Associated Landside Transport Charges	$15,660
Summary Total Cost(s):	**$60,390**
Net Reduction in Transportation Costs (i.e. benefit):	**128,230**

[1.] Illustrates only the marginal cost of a second facility initially offloading and handling landings before transport to processor located at alternative without-project facilities. Marginal costs for placement of the proposed facility are netted or accounted for in the cost analysis section of the main project report.

Table D–4a
Ponce DeLeon Inlet, Florida
Commercial Fishing Vessels (Golden & Red Crab)
Summary Table for Example of Aggregate Average Annual Costs, Revenues, and Income

Vessel Aggregate Class Statistics			
Average Vessel Length (Overall; in feet)		69.7	92.4
Average Vessel Length at Waterline (or between perpendiculars; in feet)		63.2	85.5

Commercial Fishing Vessels (Golden & Red Crab)
Summary Table for Reductions in Landside Transportation Costs
With
Placement or Location of Commercial Fishing Park

Estimated Lanside Transport Cost Reductions:	
Estimated Minimum Annual Poundage Throughput of On-Site Processing Facility (whole or live weight)	596,300
Poundage Originating from Realigned Vessel Operations (whole or live weight)	363,540
Poundage Transported Landside from Alternative Dockage Facilities for Processing (whole or live weight)	232,760
Estimated Cost(s) for Landside Shipment Per Pound Per Hundred Miles	
– Per pound; Whole or Live Weight	$0.073
– Per pound; Processed Weight	$0.108
Estimated Dockage Cost Per Pound from Alternative Facility (whole or live weight)	$0.055
Approximate Conversion Factor (for whole-to-processed weight)	1.000
Landside Transport Costs Without Commercial Park:	
Transport of Whole or Live-Weight Poundage to Processing Facility(ies)	
– Applied Pre-Processed Poundage	596,300
– Associated Dockage or Facility Offloading and Handling Charges [1.]	$32,800
– Average Minimum Landside Transport Distance (miles)	115.0
– Associated Landside Transport Charges	$49,720
Transport of Processed Poundage for Further Distribution:	
– Applied Processed Poundage	596,300
– Applied Marginal Distance Without Proposed Commercial Fishing Park (miles)	20.0
– Associated Landside Transport Charges	$12,820
Summary Total Cost(s):	**$95,340**
Landside Transport Costs With Commercial Park:	
Transport of Whole or Live-Weight Poundage	
– Applied Pre-Processed Poundage	363,540
– Associated Dockage Handling Charges [1.]	$19,990
– Average Landside Transport Distance (miles)	25.0
– Associated Landside Transport Charges	$6,590
Summary Total Cost(s):	**$26,580**
Net Reduction in Transportation Costs (i.e. benefit):	**68,760**

[1.] Illustrates only the marginal cost of a second facility initially offloading and handling landings before transport to processor located at alternative without-project facilities. Marginal costs for placement of the proposed facility are netted or accounted for in the cost analysis section of the main project report.

Table D-5
Ponce DeLeon Inlet, Florida
Commercial Fishing Vessel Maintenance and Repair Costs
Summary Table for Reductions in Landside Transportation Costs
Placement or Location of Marine Railway with Commercial Fishing Park

Total Vessel Dispatch and Return Transit Time Without Proposed Facilities:			
– Without Proposed Facilities		19.50	hours
– With Proposed Facilities		2.75	hours
Differential or Reduction		16.75	hours
Applied Aggregate Values per Hour for Vessel Transit Time:			
– Variable Vessel Operating Costs		$47.78	per hour
– Value or Cost of Time for Labor		$28.80	per hour
Estimated Reductions In Operations Costs for Vessel Dispatch and Return Time:			
– Variable Vessel Operating Costs		$800	
– Value or Cost of Time for Labor		$482	
	Subtotal:	$1,283	
	Rounded:	**$1,280**	
Associated Costs for Vehicle(s) and Labor Required for Landside Transport (in the interim between vessel dispatch and return) *			
Approximate Vessel Dispatch Radius:			
Average Vessel Speed:		8.5	knots
Approximate Distance (nautical miles) Given Speed of Vessel and Transit Time:		71.2	naut. miles
Applied Approximate Landside Statute Miles		82.0	stat. miles
Appplied Total Cost of Vehicle Per Statute Mile:		$0.31	
Total Landside Driving Distance:		328	stat. miles
Total Landside Driving Time:		6.6	hours
Applied Lanside Transportation Cost(s)			
– Vehicle		$102	
– Cost of Labor		$190	
	Subtotal:	$292	
	Rounded:	**$290**	
Summary of Total Applied Costs for Vessel, Landside Vehicle, and Associated Labor Time:			
– Vessel		$800	
– Landside Vehicle		$102	
– Costs or value of Labor:		$672	
	Subtotal:	$1,574	
	Rounded:	**$1,570**	
or;			
– Vessel Dispatch and Return Costs (including labor)		$1,280	
– Landside Transportation Costs (including labor)		$290	
	Subtotal:	**$1,570**	
Approximate Number of Months Per Year Repair Facility Will Be Operational:		10	
Approximate Number of Repairs Per Month:		3	
Total Estimated Cost Efficiencies Per Year With Marine Repair Facilities:		***$47,100***	

* *Applied distance(s) and time(s) for vehicle travel allow for travel to and from facility with vessel dispatch, and to and from facility for retrieval of vessel after repairs are complete*

Ponce DeLeon Inlet, Florida
Summary Table for Average Annual Equivalent (AAEQ) Benefits by Specified Vessel Class(es)
Recreation Navigation Benefits for Inlet Stabilization
(Based on Recreation Vessel Grounding Statistics as Reported by the United States Coast Guard (USCG))

				Vessel Class 1				Vessel Class 2				Vessel Class 3				Summary Total Nominal and Discounted Values					
Economic Life:: 50 years Applied Interest\Discount Rate: 7.125%																					
General Vessel Class --->				< 20.0 Feet Length Overall (LOA)				>= 20.0, < 25.0 Feet Length Overall (LOA)				>= 25.0 Feet Length Overall (LOA)				Estimated Benefits According to Year and Sub-Category of Benefit for Recreation All Vessels \ Vessel Classes					
Number of Vessels\Observations --->				7.9 Vessels				10.0 Vessels				10.7 Vessels									
Percentage of Occurrences Considered Preventable With Improved Conditions:				59.5%				60.0%				59.8%									
Adjusted Number of Vessels or Occurrences:				4.7 Vessels				6.0 Vessels				6.4 Vessels				17.1 Vessels					
Physical Damages Avoided --->				$3,510 per occurrence (average)				$4,600 per occurrence (average)				$4,450 per occurrence (average)				$4,610 per occurrence (average)					
Value of Time Saved --->				$190 per occurrence (average)				$190 per occurrence (average)				$190 per occurrence (average)				$220 per occurrence (average)					
Total --->				$3,700 per occurrence (average)				$4,790 per occurrence (average)				$4,640 per occurrence (average)				$5,030 per occurrence (average)

Environmental	0	to	20	points		11.42	11.58	
					Subtotal(s)	47.50	62.65	**15.15**
Nature of Recreation: General Hunting and Fishing Values								
Lower Bound UDV Ponit Value(s):						40	60	
Lower Bound UDV Monetary Value(s):						$5.35	$6.46	
Lower Bound UDV Monetary Value(s):						50	70	
Upper Bound UDV Ponit Value(s):						$5.83	$6.77	
Upper Bound UDV Monetary Value(s):						**$5.71**	**$6.54**	**$0.83**

(1.) Number of decimal places does not necessarily denote precison; values are calculated as averages based on individual UDV point value assessments.

Table D-6e

Estimation of Present Annual Inlet Use and Benefit for Recreational Boating
According to General Vessel Class and Unit\User Day Valuations
for
*With-Project Conditions **

Ponce DeLeon Inlet, Florida

Potential Average Number of Vessel Transits Per Day Per Year:	155
Less Adjustment for Cancelled Trips per Year:	17.5%
Applied Average Number of Vessel Transits Per Day Per Year:	128.0

General Recreational Vessel Class (According to Length Overall [LOA] in Feet)	< 20	> 20; < 25	>= 25	Total(s) All Classes
Estimated Used	27.5%	35.0%	37.5%	100.0%
Applied Number of Vessel Transits Per Day According to Vessel Class	35.2	44.8	48.0	128.0
Average Estimate of Vessel Compliment or Users per Vessel Transit	2.8	2.8	2.8	2.8
Average Estimate of Vessel User Occassions per Day	98.6	125.4	134.4	121.4
Average Marginal Benefit Per User-Occasion Derived from Changes in Unit\User Day Valuations for With Versus Without Project Conditions	$0.75	$0.87	$0.83	$0.82
Average Estimated Benefit Per Day by Vessel Class	$73.92	$109.13	$111.55	$100.36
Total Estimated Benefits Per Day				$294.60
Applied Number of Days Per Year				365
Total Estimated Benefit per Year by Vessel Class for Unit\User Day Valuations for Recreational Vessel Use	$26,981	$39,833	$40,716	$107,531
			Rounded:	$107,530

* *Estimated benefit(s) are estimated for calendar year 1997 and do not include allowances for projected growth derived from the Florida State Comprehensive Outdoor recreation Plan (SCORP; 1994) for the study region. With-project conditions includes efforts to improve in stabilization, but excludes consideration of limited deepening also proposed for intensified commercial usage of the inlet.*

Table 6

Ponce DeLeon Inlet, Florida

Summary Table for Average Annual Equivalent (AAEO) Benefits by Specified Vessel Class(es)

Recreation Navigation Benefits for Inlet Stabilization

Unit\User Day Valuation(s) (UDV)

Economic Life::	50 years			Vessel Class 1				Vessel Class 2				Vessel Class 3				Summary Total Nominal and Discounted Values Estimated Benefits According to Year and Class

Commercial Benefits	**$290,980**	**$612,930**
Recreational Benefits	**$466,170**	**$466,170**
Summary Total(s); All Benefits	**$757,150**	**$1,079,100**

Description of Economic Analyses as Completed for Economic Justification of the South Jetty Extension (phase III as described preceding; completed in July of 1998; detailed study phases 3)

Subsequent to completion of the economic assessment of the north and south jetty extensions, revetment and fishing park, after further evaluation by the local constituency it was determined that the placement and operation of commercial seafood processing facilities was an unacceptable specification of the overall proposed project. Therefore, such landside features have been eliminated from further consideration for construction or placement. In addition, it was determined by the Jacksonville District with HQUSACE review that placement of the proposed revetment could be achieved or justified under requirements for future operation and maintenance (O&M) for the existing Federally-sponsored project. This represented a change in general position approximately four to five years earlier that any significant augmentation of the existing project would have to be economically justified as new work.

In an effort to explore the minimization of costs that would have to be economically justified (as new work), discussion(s) with Construction-Operations Division of the Jacksonville District subsequent to the determination that significant features would have to be primarily justified as new work did result in the allowance of the first 800 to 900 feet of a total landward extension of the north jetty (totaling 2,400 to 2,500) feet as a without-project condition requirement to protect integrity of the north jetty. The remainder of the landward extension therefore has been termed a revetment to clarify the difference between construction allowances that until recently would be Federally-sponsored under without-project conditions (an extension) compared to total and\or marginal allowances of the north jetty system that would be described for new work justification (a revetment). Given that the recent determination allows both the north jetty extension and connecting revetment to be placed under assumptions concerning requirements for future operation & maintenance, the only remaining costs to be analyzed for justification pertain to the south jetty extension. To determine related economic benefits, the separable or incremental effects of described features would have to be reasonably determined for economic studies. Previously is was presumed from an engineering and economic position that all waterway features as originally proposed were non-seperable and required together or in combination to achieve acceptable stabilization of the inlet system. To assess effects specific to the south Jetty, the location of sedimentation within the inlet system that may be prevented by the south jetty extension had to be assessed. Historical maintenance requirements were reviewed combined with further numerically-based sediment modeling to arrive at basic determination as to where sedimentation would occur and possibly

influence vessel operations. Related efforts resulted in findings that indicate the vast majority of sediment that would be precluded from entering the inlet system by the south jetty extension would other fall within reaches of the Intracoastal Waterway (IWW) extending from reaches to the north of the halifax river to the south past the confluence with the inlet waterway. As such it was determined that beneficial effects of the jetty extension regarding sediment transport would largely pertain to savings in maintenance for the IWW as opposed to reductions in vessel damages, especially for commercial vessels. Correspondingly, benefit estimates have been revised to reflect current assumptions. Revised estimates for benefits to commercial vessels total an average annual equivalent (AAEQ) value of $48,000, while benefits to recreational craft total $262,600.

****
****

b.) savings in operations costs associated with marginal waterborne transit time due to occluded access waterways resulting from seasonal dynamics of the inlet system,

and;

c.) lost operating revenue and income due to unnavigable conditions for commercial operators. Cost efficiencies or economic benefits for recreational craft were limited primarily to reductions in physical vessel damages, and applicable reductions in costs for reduced transit time (where applicable).

The estimated costs for such repairs for commercial vessels typically ranges from a low of about $220 to a high of over $2,300 with an average of approximately $860 per occurrence. In addition, to benefits associated with direct costs of repairs or maintenance, benefits were also assessed for the operations expenses of delays or transit diversion due to inlet conditions unique to without-project conditions (i.e., such addition fuel or oil expended, etc.) and the value of time required for repairs or downtime, lost business or additional transit time and delays based on either computations for opportunity costs derived from vessel operations data, or in reference to general procedures as outlined in the IWR publication *The Value of Time Saved for Use in Corps Planning Studies - A Review of the Literature and Recommendations (IWR publication 91-R-12; dated October 1991)*. As a result, average annual benefit valuations for commercial and recreational vessels is as follows:

- Reductions in Physical Damages to All Commercial Vessels (commercial fishing and charter sportfishing) -- > **$91,640**
- Opportunity Costs Saved in Association with Reduction(s) in Physical Damages (Charter Operations) -- > **$29,250**
- Operations Costs for Diversion and Delays for Commercial Fishing Vessels Due to Inlet Conditions --> **$17,910**
- Harvest Yield Foregone for Commercial Vessels (longline and *shrimp harvest operations*) --> **$11,290**
- Net Income Associated with Business Lost or Foregone for Charter Operations --> **$27,650**
- Operations Costs for Diversion and Delays for Charter Fishing Vessels Due to Inlet Conditions --> **$4,640**
- Opportunity Costs Saved in Association with Reduction(s) in Physical Damages (Longline\Commercial Fishing -- > **$11,180**
- Operations Costs for Diversion and Delays for Transient or Seasonal Commercial Fishing Vessels Due to Inlet Conditions --> **$29,660**

- Opportunity Costs Saved in Association with Reduction(s) in Physical Damages -- > **$15,720**

Described benefits total **$238,940** for the existing vessel base which routinely uses the inlet system.
inflicting damages to propellers and hull surfaces which often do not required immediate pulling of the vessel for inspection and repair.

Therefore, based a preceding information, a weighted average of approximately 7.5 man-hours was utilized for incidence of labor time require for repairs. The aggregate applied value per unit of time for reduction of expenses associated with damages and related repairs or maintenance area is approximately $11.48 per hour based on the value of 7.5 man-hours per occurrence for damage repairs deemed attributable to correctable conditions of the inlet

Reductions in Damages to Vessels. A density plot of a USCG search and rescue data base, figure _, indicates a total of 347 vessels aground during the FY-81 to FY-91 period. Almost all of the groundings shown are between the north and south jetties of the inlet, the Halifax River channel to the north, the Indian River channel to the south, or the throat of the inlet at the junction of Rock House Creek with those two channels. Discussions with USCG personnel at their Ponce De Leon Inlet Station, indicate that if a vessel runs aground and is not in immediate danger no USCG response is required. Grounded vessels not in immediate danger must rely on others such as salvage boat operators to assist them. The numbers shown represent only those vessels that went aground and required a USCG response.

An interview with a boat yard owner located on the north side of the inlet, reveals that he keeps his radio on constantly to assist boats passing along the Halifax River channel since it is not marked by the USCG. Many vessels run aground trying to reach his boat yard or the entrance channel but do not make it there for fear of running aground again. As a result those boaters go around the unmarked Halifax River channel by way of the AIWW.

Interviews with commercial vessel operators and boat yard owners in the area indicate an average of 35 to nearly 50 minutes one way as the additional time required to use the AIWW and the Indian River as an alternative access to the entrance channel when the Halifax River channel was shoaled-in during the prior breakthrough. During that breakthrough commercial charter boat and head boat operators as well as a boat yard located behind the north spit were shoaled in until the breakthrough was stopped and the shoals in their access channels and the Federal channel in the Halifax River were removed. All boat traffic along the Halifax River channel had to use the Intracoastal Waterway and

the Indian River channels as an alternative means of getting out of the inlet.

As a result of the continued migration of the entrance channel up against the north jetty and spit, unscheduled maintenance is estimated to start during the end of FY-93. The current plan involves placing maintenance material from the AIWW near Rock House Creek on the north spit in way of the potential breakthrough area. Other projected maintenance within the next three to six years involves placement of a scour apron along the landward end of the north jetty and placement of rock to fill in slumped areas. Estimates for the scour apron and additional rock to fill in slumped areas of the north jetty total $1,444,000 and $126,000 respectively (See Engineering Analysis Appendix B Plans C and D for details). Interviews with personnel from four marinas or boat yards and one propeller and shaft repair facility owner indicate an average of 3 propeller and shaft jobs per week over the course of a year. All of the Marinas or boat yards involved in the interview were located north of the inlet and were capable of hauling out boats for removal of propellers and shafts. The average cost of repairs was $782. The total yearly cost for repairs to propellers and shafts from those four repair facilities is $488,124.

With improvements to the inlet resulting in a more stable north channel which the USCG would agree to mark, it is estimated that 90 percent of the propeller and shaft repairs could be eliminated resulting in a savings of $439,312 per year. Of that amount approximately 10 percent ($43,391) is estimated to represent commercial vessels and 90 percent ($395,380) recreational vessels.

If generally described improvements are not implemented improvements are not made, it is assumed that the following without improvement conditions will result.

Information assembled to-date indicates that an average minimum of 40 to 45 occurrences are expected each year which require vessel operators or owners to secure or perform repair services resulting in minimum value of time saved totaling approximately $3,660 annually. Based on preceding values, the value for reductions in damages and associated labor time total approximately *$57,100* per year.

The values total or average on an annual basis approximately $7,000 to $9,000 dollars for hull or structural damages and approximately $8,500 to $12,000 for mechanical or machinery damages such as damaged propellers and steering gear. Allowing for application of averages of approximately $15,500 and $21,000 for hull and machinery damages respectively, annual estimated damages for catastrophic loss or severe damage incidents total an

expected minimum average of $15,500 per year.

only during months of the year previously described when waterway conditions were deemed less than ideal.

Estimated costs for such repairs for commercial vessels typically ranges from a low of about $220 to a high of over $2,300 with an average of approximately $860 per occurrence. In addition, to benefits associated with direct costs of repairs or maintenance, benefits were also assessed for the operations expenses of delays or transit diversion due to inlet conditions unique to without-project conditions (i.e., such addition fuel or oil expended, etc.) and the value of time required for repairs or downtime, lost business or additional transit time and delays based on either computations for opportunity costs derived from vessel operations data, or in reference to general procedures as outlined in the IWR publication *The Value of Time Saved for Use in Corps Planning Studies - A Review of the Literature and Recommendations (IWR publication 91-R-12; dated October 1991)*. As a result, average annual benefit valuations for commercial and recreational vessels is as follows:

Described benefits total **$238,940** for the existing vessel base which routinely uses the inlet system. In addition, recent information indicates that a new fishery will soon be open for the harvest of golden and red crab and it is projected the opening of this fishery will bring approximately 11 vessels to the inlet area for operations. Based on applicable procedures for analysis of net income, it is estimated that improved conditions will enable each vessel to increase its intensity of employment and harvest yield by approximately 4 to 5 percent or enable approximately two to three additional trips per year. Net income for exvessel compensation of harvests ranges from a probable minimum of approximately $4,000 per trip to in excess of $8,200 per trip. Applying and average of 2.5 trips per year per vessel and an average net increase in income $5,290 per trip renders a benefit of approximately $145,480 per year. Estimated benefits for these vessels for savings in time and operations expenses under with-project conditions total an additional 53,540 per year for a total commercial project economic benefit of **$437,960** per year. Corresponding benefits for reduction in damages to recreational craft and value of time saved for inlet users equals approximately **$248,210** and **$24,290** respectively. These values provide a summary total of **$710,460** of average annual equivalent benefits.

SUMMARY REPORTS SUMMARY PAGE

No Detailed Estimate...

No Backup Reports...

* * * END TABLE OF CONTENTS * * *

Descriptions of Project:
These are a series of comparison estimates to be used for determining benefits of the selected plan.

Contingencies:

20% Contingencies were used for Construction Costs in the estimate due to the unpredictable availability of Marine Equipment.
