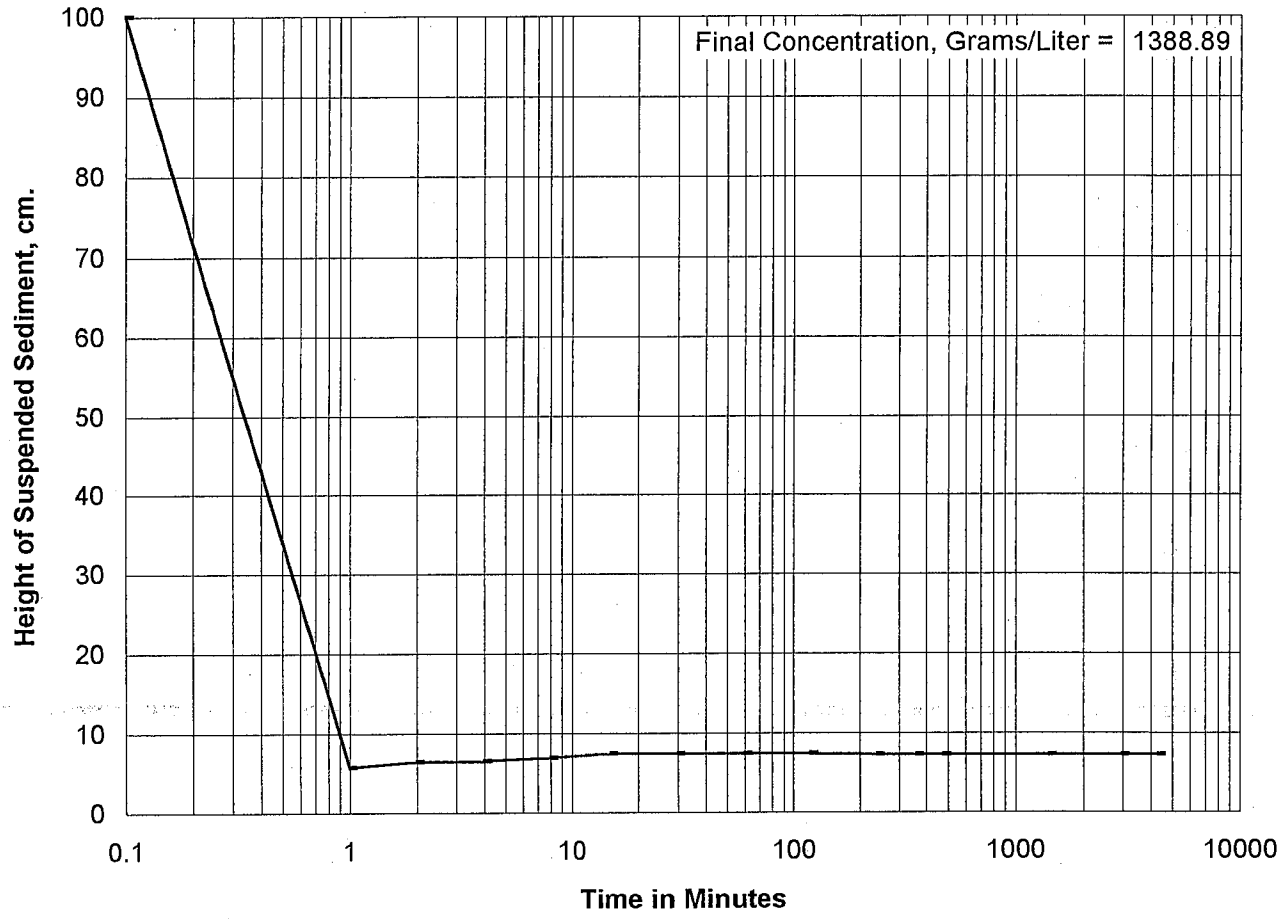
U.S. ARMY CORPS OF ENGINEERS
SOUTH ATLANTIC DIVISION LABORATORY
MARIETTA, GEORGIA

SUSPENDED SEDIMENT-TIME CURVE



NOTES:
1. Test specimens (100 grams/ liter ,moist weight of specimen) suspended in sea water(salinity about 11 ppT) in 100 cm. long bottom withdrawal tubes.
2. Suspended sediment-time curves represent the contact surface between the sediment still in suspension and the "clear" water on top at the elapsed time indicated.
3. See grain-size data on enclosed gradation curve.
4. Percent Solids = 89.64

SUBSURFACE EXPLORATION REPORT
LAKE WORTH INLET CORINGS
PALM BEACH COUNTY, FLORIDA

Ardaman & Associates, Inc. has completed the subsurface exploration and studies of the project site described in our proposal dated July 6, 1994. The work was requested by Mr. Douglas Mann of Coastal Planning & Engineering, Inc. and authorized by Robert Clinger of Palm Beach County Environmental Resources Management. Our work included two Standard Penetration Test (SPT) borings with cores, laboratory testing, and engineering analyses. This report describes our explorations and tests, reports their findings, and summarizes our conclusions. Our report has been prepared specifically for this project. It is intended for the exclusive use of Coastal Planning and Engineering, Inc. and their representatives.

FIELD EXPLORATION

Two Standard Penetration Test (SPT) borings were performed at the locations shown on the Boring Location Plan, Figure 1. The SPT borings were completed at depth 100 feet. The work was performed in accordance with the procedures recommended in ASTM D-1586. The boring logs and a description of our drilling and testing procedures are included in the Appendix.

In addition to the SPT borings, nine 5 foot coring runs were performed at the depths described in the boring logs.

The boring locations were laid out by our field crew by tape measurements from nearby jettys. We estimate that the actual boring locations are within about 10 feet of the locations shown in Figure 1. If you need to know the boring locations more accurately, we recommend that you retain a surveyor. Note that the drilling locations are not accessible to our standard tire-mounted equipment.

Our drillers examined the soil recovered from the SPT sampler and maintained a log for each boring. The soil samples were taken to our laboratory where they were inspected and classified using nomenclature consistent with the Unified Soil Classification System (ASTM D-2487). The soil classifications and other pertinent data obtained from our explorations and laboratory examinations and tests are reported on the boring logs in the Appendix.

[illegible]
[illegible]

The soil samples recovered from our explorations will be kept in our laboratory for 60 days, then discarded unless you request otherwise.

SUBSURFACE CONDITIONS

The boring logs in the Appendix present a detailed description of the soils encountered at the locations and the depths explored. The soil stratification shown on the boring logs is based on examination of recovered soil samples and interpretation of the driller's field logs. It indicates only the approximate boundaries between soil types. The actual transitions between adjacent soil strata may be gradual and indistinct.

CORING

A total of nine, two-inch diameter, coring runs were attempted at different depths in Boring B-2 as directed by the engineers. Most of these runs were made at depth below 30 feet, which was not anticipated. The depths, descriptions, and percent recovery are described on the boring logs in the Appendix. Two core samples from each of the first six coring runs and one core sample from the seventh run were tested for compressive strength according ASTM D-2938. Core samples from coring runs 8 an 9 could not be tested. Table I shows the results of the compression tests.

TABLE I
COMPRESSION TESTS
FEBRUARY 13, 1995

Attention: Mr. Jim Bowser

Additional Borings
Directionally Drilled Pipeline
Lake Worth Inlet
Palm Beach County, Florida

Per our recommendation, the Town of Palm Beach subcontracted a subsurface drilling company to perform up to three additional borings at the reference project. The purpose of the borings was to further investigate the subsurface conditions in the area of alternative alignments proposed by Counties Corporation for the continuation of efforts to install the directional drilled pipeline beneath the inlet. The borings were also specifically performed to investigate and address the depth of the jetty in the alternate alignment area as the contractor, Counties Corporation, is claiming the jetty extends to a depth of 45 feet in this area.

The location of the borings performed is shown on the attached Site plan, Plate 1 and Boring Location plan, Plate 2. Boring DM-4 was drilled through the top of the concrete jetty cap at a location just south of previous boring DM-3. Boring DM-5 was also drilled down through the top of the jetty cap at an accessible location 125 feet east of DM-5. Boring DM-6 was drilled approximately 45 feet north and approximately 50 feet east of boring DM-4. Boring DM-6 was located north of the jetty, intermediate to the alternative alignments proposed by Counties Corporation. This boring was performed to locate the top of the underlying Coquina rock layer at that location. The results of the borings through the jetty at locations DM-4 and DM-5, indicates that the jetty material was found to a depth of 12 feet beneath the top of the jetty at both locations. The performance of the borings was observed by a representative of Counties Corporation. Summary generalized descriptions of the materials encountered in the borings are as follows:

Boring DM-4 (Elevation +6.2 feet NGVD)

Depth (feet)	Description
0 - 8	Concrete jetty cap

DAMES & MOORE

8 - 12	Granite jetty rip rap and sand infilled voids
12 - 22	Brown fine to medium sand with shell fragments
22 - 23	Gray fine sand, (dense)
23 - 50	Gray, moderately to well cemented sand and shell (Coquina)

Boring DM-5 (Elevation +6.2 feet NGVD)

0 - 8.25	Concrete jetty cap
8.25 - 12	Granite jetty rip rap
12 - 23.5	Brown, medium to fine sand with shell fragments, (medium dense to very dense)
23.5 - 34	Gray, fine sand with fragmented shell, (medium dense to very dense)
34 - 40	Brown gray medium sand and shell, uncemented, (dense)
40 - 47	Gray fine sand with fragmented shell and trace of silt, (medium to very dense)
47 - 50	Gray brown and tan, cemented fine sand and shell (Coquina)

Boring DM-6 (Elevation 7.0 feet NGVD - Estimated)

0 - 17.5	Brown, fine to medium sand and shell, (dense)
17.5 -26.5	Gray fine sand, (dense)
26.5 - 35	Gray, moderately to well cemented sand and shell (Coquina)

DAMES & MOORE

Detailed descriptions and the results of the borings are provided on the attached boring logs, Plates 3, 4 and 5.

Based on the above, there is factual boring data to contradict the reported assessment of the contractor's geophysical report which stated that the jetty rock was located to a depth of 45 feet at the DM-3 area. The jetty rock was found only to a depth of 12 feet below the top of the jetty in borings DM-4 and DM-5 indicating the rip rap was likely placed on the prevailing ground surface at the time the jetty was constructed in 1925 and that the geophysical report missed this layer altogether. Furthermore, the result of these borings indicate the geologic conditions encountered to be consistent with those reported by and reflected in the borings provided to the contractor at the time of the bid.

Respectfully Submitted,
DAMES & MOORE, INC.
