BUILT ENVIRONMENT

FEDERAL CHANNEL

- Inner Channel: Deepen (from 33' to 39'); Widen (from 300' to 450' minimum)
- Entrance Channel: Deepen (from 35' to 41'); Widen (from 400' to between 440' and 460'); plus south approach flare
- North Turning Basin: same
- Main Turning Basin: Depth: Deepen (from 33' to 39'); Width: 150' extension to the south & removal of notch on north side North and South Jetties: North Jetty will need sheetpile stabilization
- primarily because of the revised maintenance plan
- O&M: refer to advance maintenance discussion below

PLACEMENT OPTIONS

- Suitable material to be placed in the nearshore
- Non-beach compatible material will be placed at the Palm Beach Ocean Dredged Material Disposal Site (ODMDS) 4.5 miles offshore - in compliance with ocean disposal criteria; study will increase allowable disposal to > 500,000 cy per event
- Refer to Natural Environment discussion regarding Turtle Cove Dredged Hole Site and Singer Island Artificial Reef Mitigation Sites

alophila johnsonii (Hj)

Hj/Hd/Hw Halodule wrightii (Hw)

Peanut Island not a viable option due to limited capacity

PORT FACILITIES

 Port will modify bulkhead and deepen Slip 3 to depth (39') minimum

NATURAL ENVIRONMENT AND MITIGATION PLAN

MITIGATION REQUIRED

- Under negotiation: 8.25 to 11.25 acres of seagrass mitigation and 4.9 to 9.8 acres of hardbottom mitigation
- Proposed seagrass mitigation will fill dredged hole(s) to surrounding elevation using dredged material to allow restoration of seagrass
- Proposed hardbottom mitigation will place rock in artificial reef sites to allow establishment of species

(Refer to Chapter 5.0 for a full comparison of the Tentatively Selected Plan to the Future-Without Plan/No Action Condition)

NAVIGATION ENVIRON

- Improved maneuverability for large vessels (tankers, b and cruise ships)
- Improved access into inlet considering currents and w
- Less dependence on tide windows (for underkeel) during transit
